Designing a Research Based Leadership Studies Curriculum & Content for Undergraduate STEM Students
Abdullah Salim – Biological Sciences Major – Honors Biochemistry Concentration

Description/Statement of the Problem(s)

Often, when we discuss leadership, we talk about it in the context of academic fields such as the humanities or non-academic fields such as business. In doing so, it can be easy for STEM students to feel left out of the discussion and to experience difficulties in figuring how to practice leadership within their fields.

Rationale for the Capstone

As a biochemistry student minor in leadership studies, I have seen firsthand how leadership studies and development can be extremely impactful in scientific fields, especially when applied through research. In everything from generating meaningful research questions to setting goals and deliverables to team-work skills and scientific communication, I have seen that leadership can be practiced and applied in everything that I do as a STEM student.

The Project/The Selected Approach to the Problem

My project seeks to bring STEM students into the leadership conversation by offering them leadership training and content that is applicable to them. Specifically, my project is a research-based applied leadership curriculum that consists of content presentations that aim to demonstrate the effectiveness of research as a leadership studies practicum. These presentations inform and educate undergraduate STEM students on how to best and most meaningfully engage with leadership in their fields of interest through research. They highlight how students can practice active leadership—exercising the Kouzes & Posner Practices and Commitments of Leadership [2]—within their undergraduate research teams. The presentations also highlight how students can utilize a research experience to strengthen career readiness skills and competencies. Ultimately, this project aligns with my personal values and vision of expanding equality and empowering people through education.

Values: My project is grounded in three key values—equality, achievement, and excellence. Vision: The vision of this project is to bring the study of leadership to all students so that they can all be challenged to grow as leaders and professionals while simultaneously positively impacting their communities. Mission: The mission of this project is to create a research-based leadership studies curriculum and content to more meaningfully engage STEM students in leadership studies and development.

Project Timeline

- I spent the summer of 2020 working on incorporating the lessons I learned from my leadership studies practicum into a leadership studies curriculum composed of 12 topics/presentations.
- During the Fall 2020 and Spring 2021 semesters, I worked with Dr. Karen Boyd, my leadership studies coach & advisor, to improve this content and delivered it jointly to a leadership practicum course within the Minor.
- Over the course of my graduation semester (Spring 2022), I have been finalized my content presentations, incorporating the feedback and lessons learned from delivering them to students in the Minor.

Leadership Highlights

Synthesizing everything that I have learned over the past four years—as a STEM student and as a leadership studies student—and delivering that as a final product/resource that help facilitate the educational experience of my STEM peers.

Final Project Status

The final product is a practicum-based leadership studies curriculum tailored specifically for STEM students engaged in research as a leadership practicum. While not perfect, these leadership content presentations can be a launching pad that undergraduate STEM students utilize to inform themselves on how to exercise leadership through their work as researchers.

The starting vision of this project was to expand opportunity for STEM students to engage in leadership studies and this project has put in place the foundation for that to occur.

Future Project Plans

- In terms of the project, the next step is to take the curriculum and content presentations developed and turn them into a video library of presentations. This can then be accessed and utilized by any undergraduate student without needing the content to be delivered live.
- In terms of my personal career trajectory, I plan to continue my pursuit of science, leadership, and academia by seeking an MD-PhD.
